— Dear Secretary of State,

We write with surprise and dismay concerning the recent news of severe effective cuts in STFC's ability to fund UK research in physics. This is particularly unfortunate at the present time when the government has identified physics as a strategically important subject and is starting to succeed in encouraging more youngsters into science.

UK physics departments receive a large fraction of their income from STFC grants, and the financial situation of many UK physics departments would be perilous if this income were substantially reduced, forcing their possible closure in a number of cases. For example, 58% of the research funding in the Physics Department at Durham University, one of the UK's most internationally esteemed departments, comes from STFC. Similar figures apply to most other major UK physics departments.

The STFC supported research in astronomy and particle physics has also been shown to be one of the main draws of young people into the study of physics, both at school and university level. In recent surveys approximately 50% of beginning undergraduate physics students quoted such research as the primary reason for their interest in studying physics at university level.

Thus the essential effect of the proposed cuts in STFC research funding would be to strongly discourage future generations of UK children from studying physics, and science more generally we believe, both by the direct impact on the financial health of UK physics departments, and indirectly due to the substantial reductions in the UK's involvement in exciting forefront research.

On the research side STFC plays a central role in supporting the UK program in both astronomy and particle physics, as well as providing resources and facilities for the scientific community more generally and particularly underpinning much of the potential for major advances in the life sciences. Many of the supported programs are about to come to fruition, and it seems to make no sense to us to have invested large sums over the past decade and then to lose our current positions of international leadership and let our international partners harvest the rewards.

STFC supported research also generates many major spin-offs for the UK economy. For example, mathematical ideas developed by theoretical physicists in recent years have found application in biology, nanotechnology and finance. Another important benefit for the UK economy is the education of a stream of young people with advanced computational and mathematical skills, who unusually also possess excellent teamwork abilities. The STFC program as a whole is a magnet for the brightest young minds who go on to deploy their exceptional acquired skills in a wide range of careers ranging from the computer industry to investment banking.

In closing we strongly support the work of the STFC in underpinning UK physics, and ask that the serious implications of the recent CSR for STFC and UK physics be considered.

Yours sincerely,

UK Theoretical Particle Physics Community
