

# Data-Driven Physics Aware Learning for Disruption Prediction in Nuclear Fusion

Katya Richards

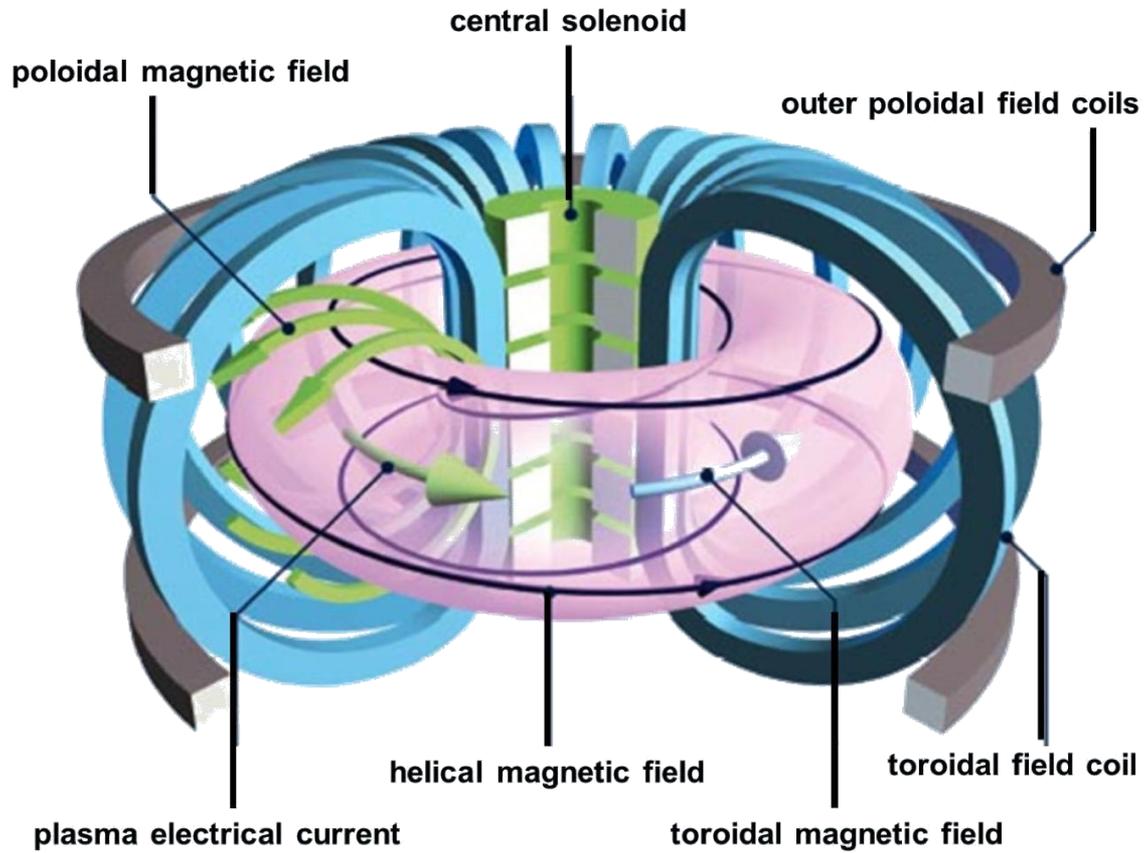

UK Atomic  
Energy  
Authority

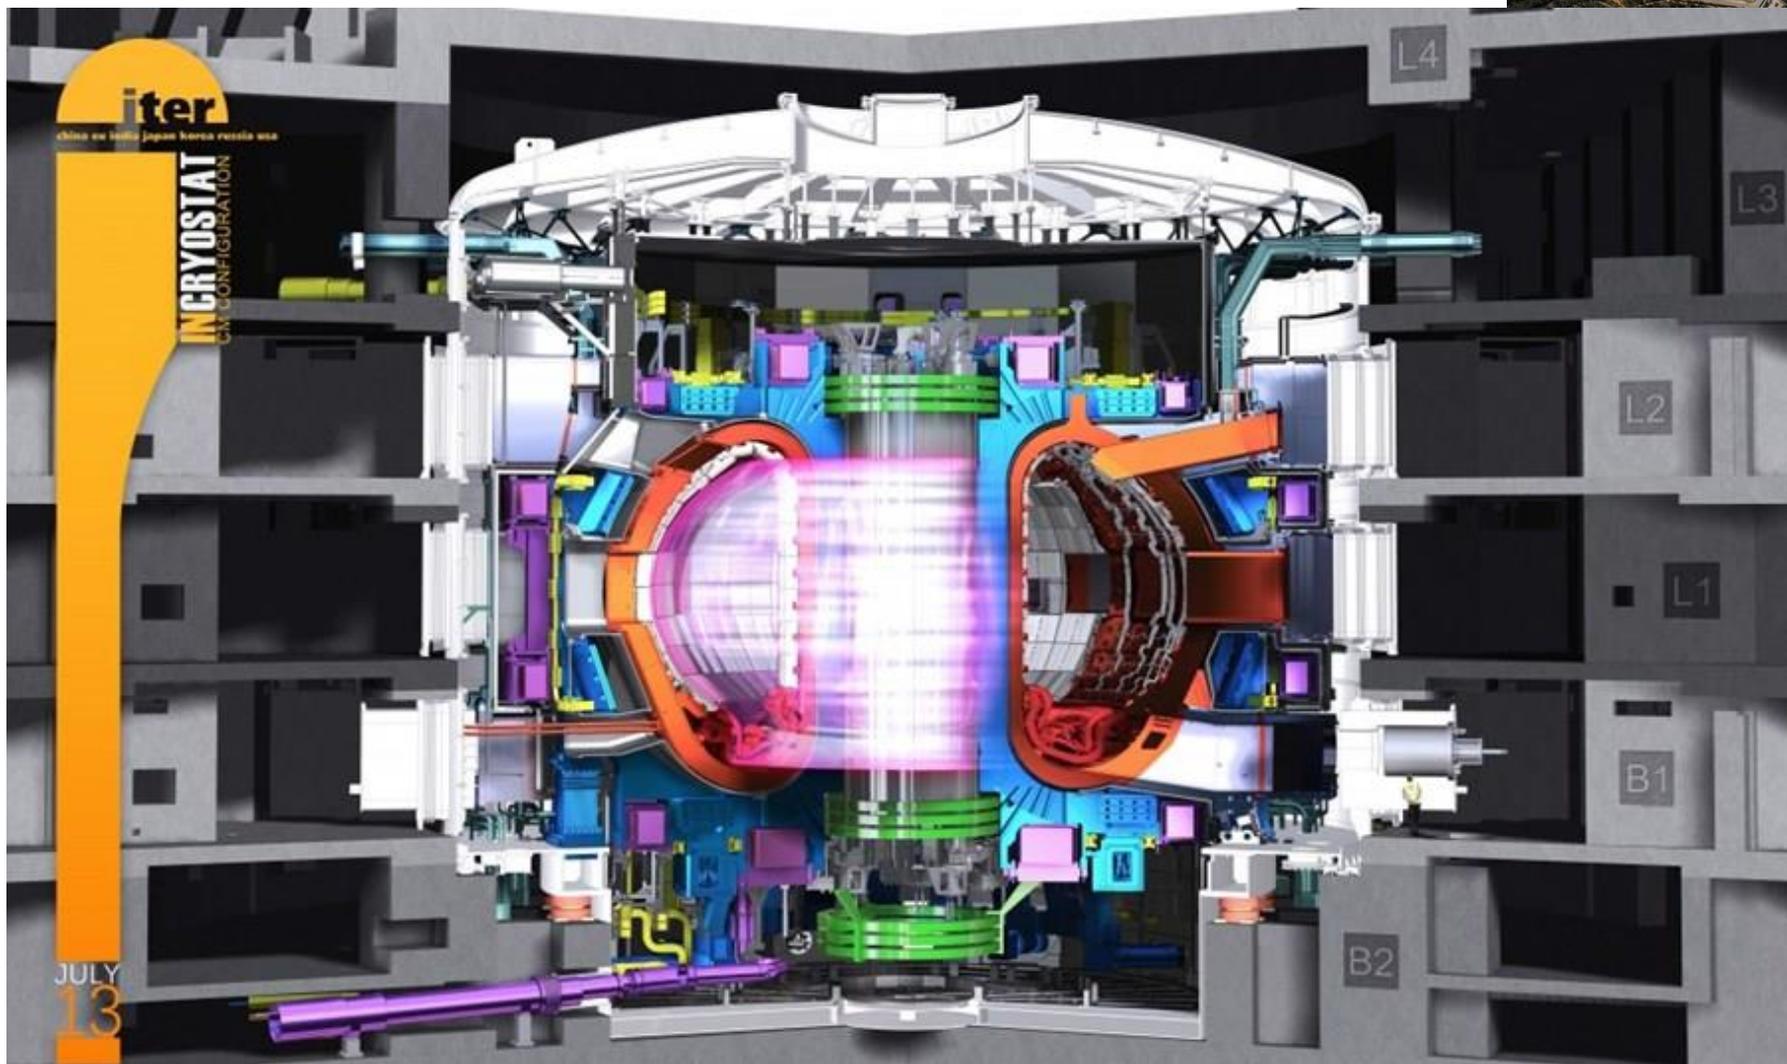

# Tokamak

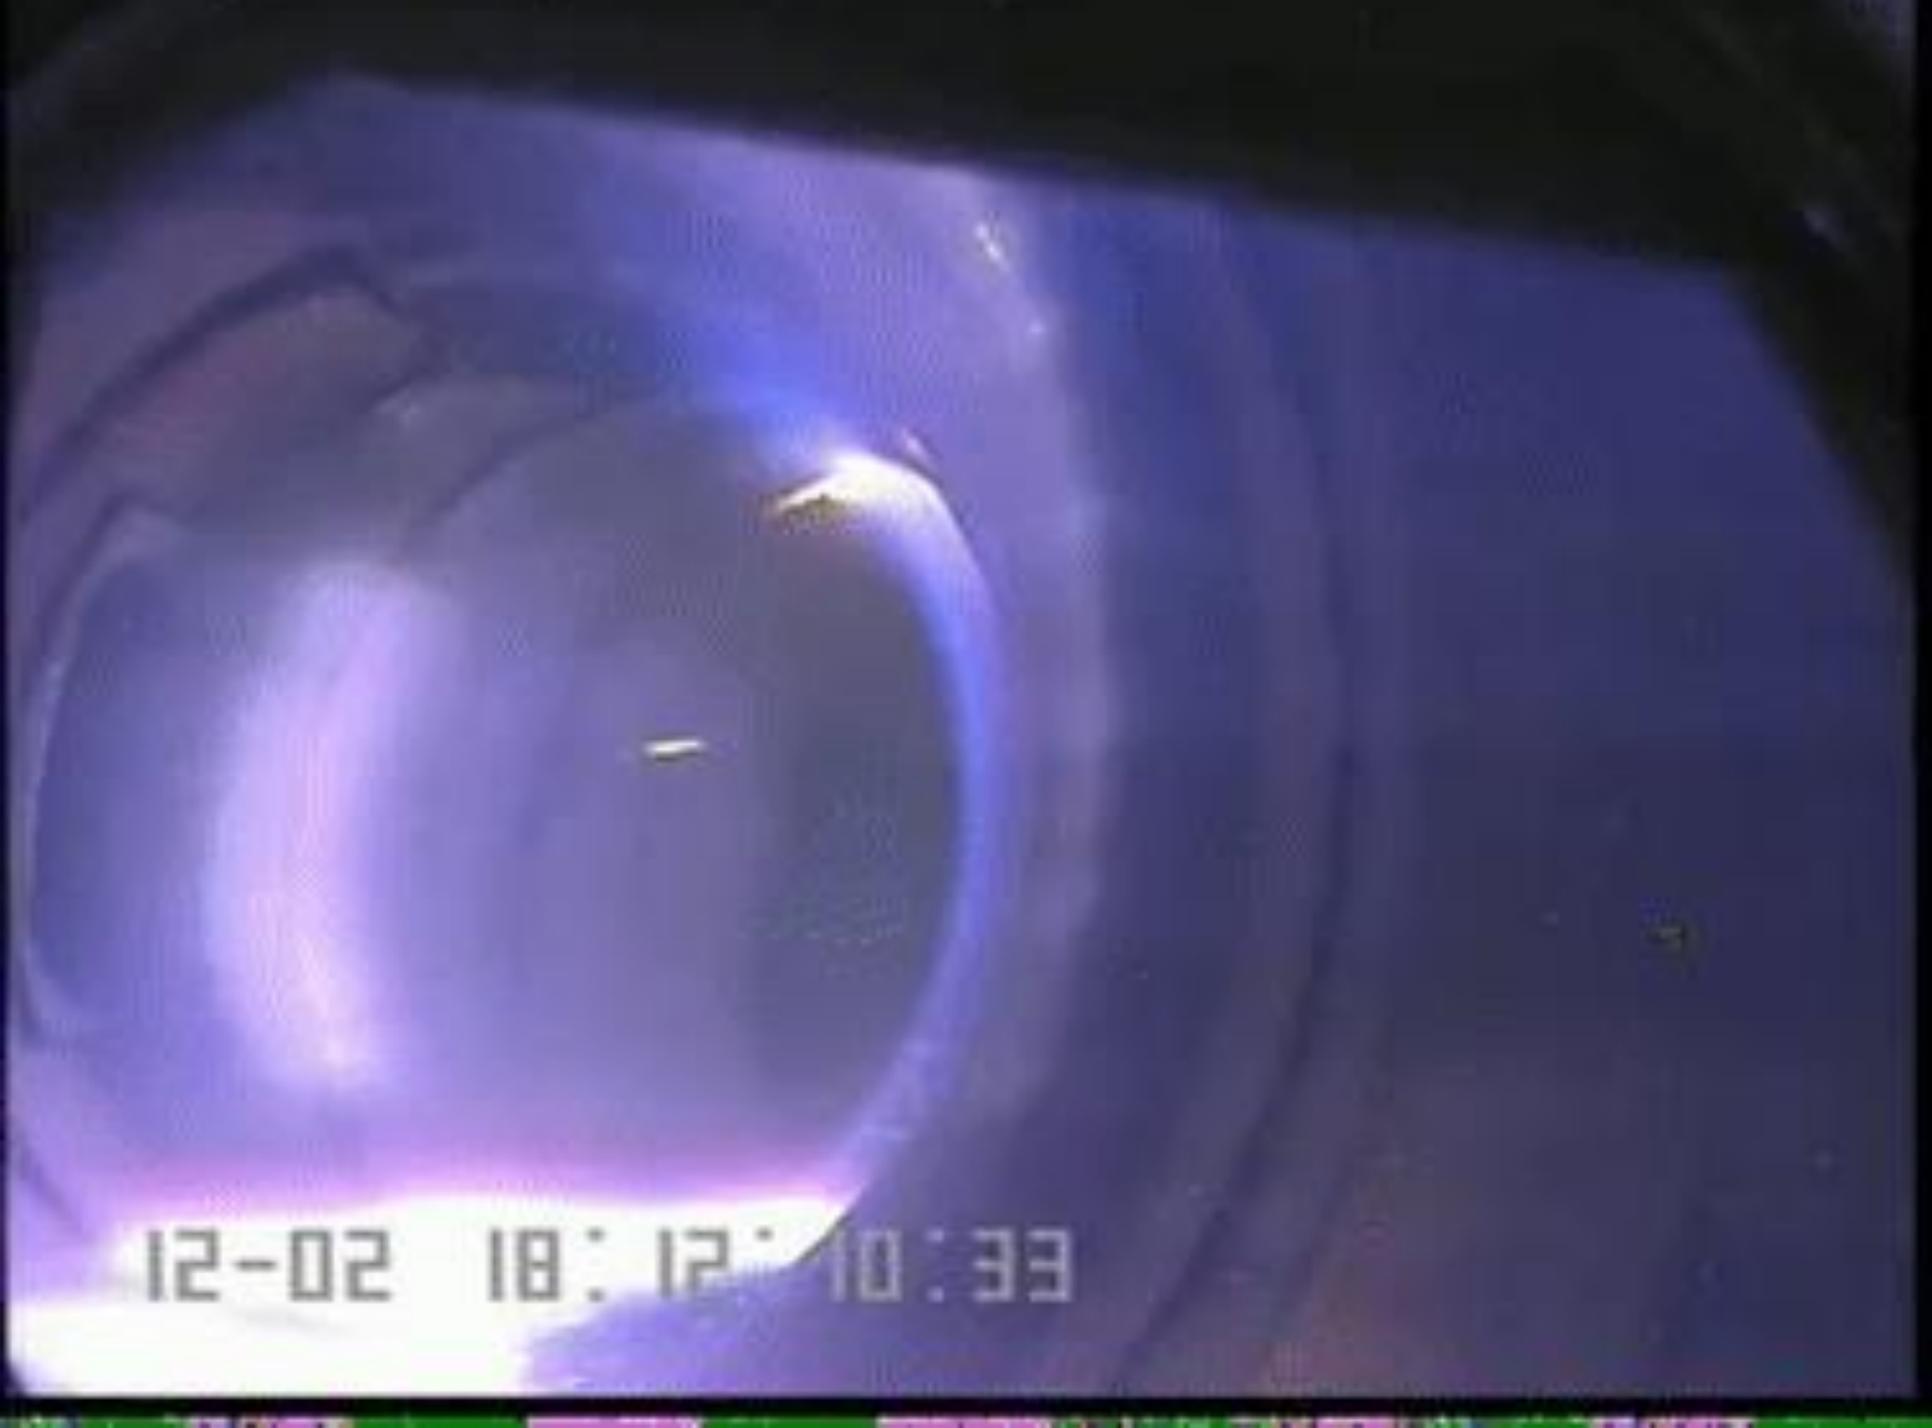

# ITER

# Disruptions

- It's not all sunshine
- Symptoms include:
  - Sudden loss of confinement
  - Melting of walls
  - Lifting of entire tokamak off ground

12-02 18:12:10:33

# Big Disruptions

- It gets worse
- 15000 tons worse

*“On a small tokamak, it doesn't matter so much if you let the plasma go bang...”*

- Remind audience that disruptions are not meltdowns

# Disruption prediction

- All is not lost!
  - 30ms warning needed

# Same-tokamak

### Abstract

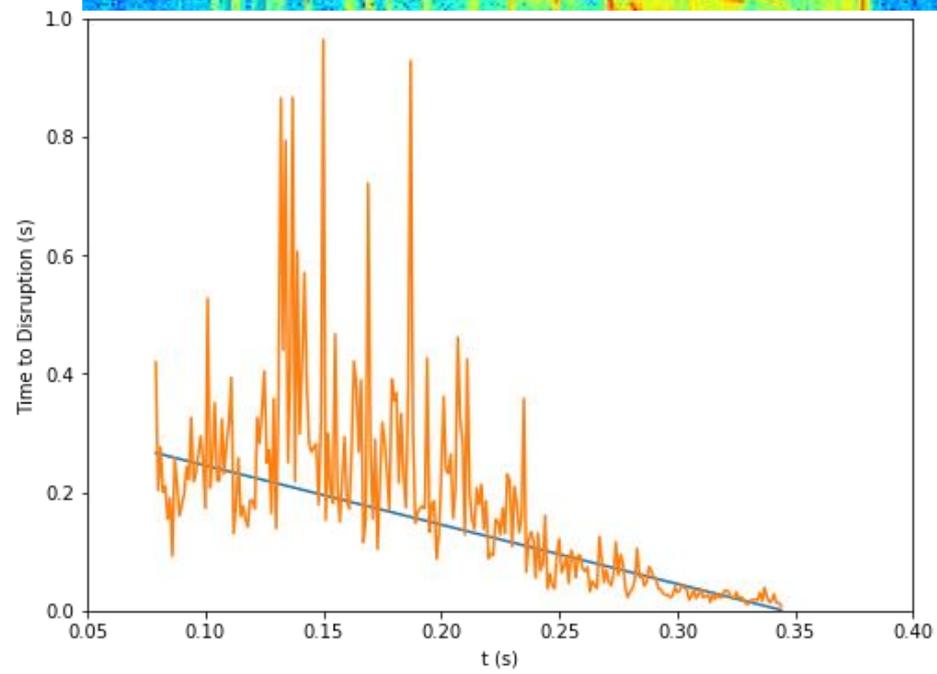

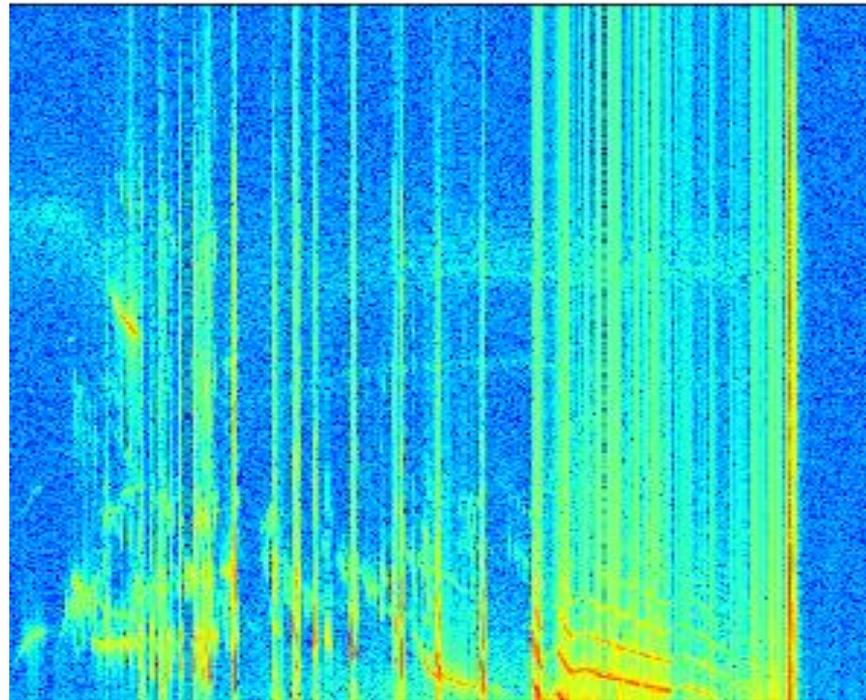

This paper introduces a novel framework for combining scientific knowledge of physics-based models with neural networks to advance scientific discovery. This framework, termed as physics-guided neural network (PGNN), leverages the output of physics-based model simulations along with observational features to generate predictions using a neural network architecture. Further, this paper presents a novel framework for using physics-based loss functions in the learning objective of neural networks, to ensure that the model predictions not only show lower errors on the training set but are also scientifically consistent with the known physics

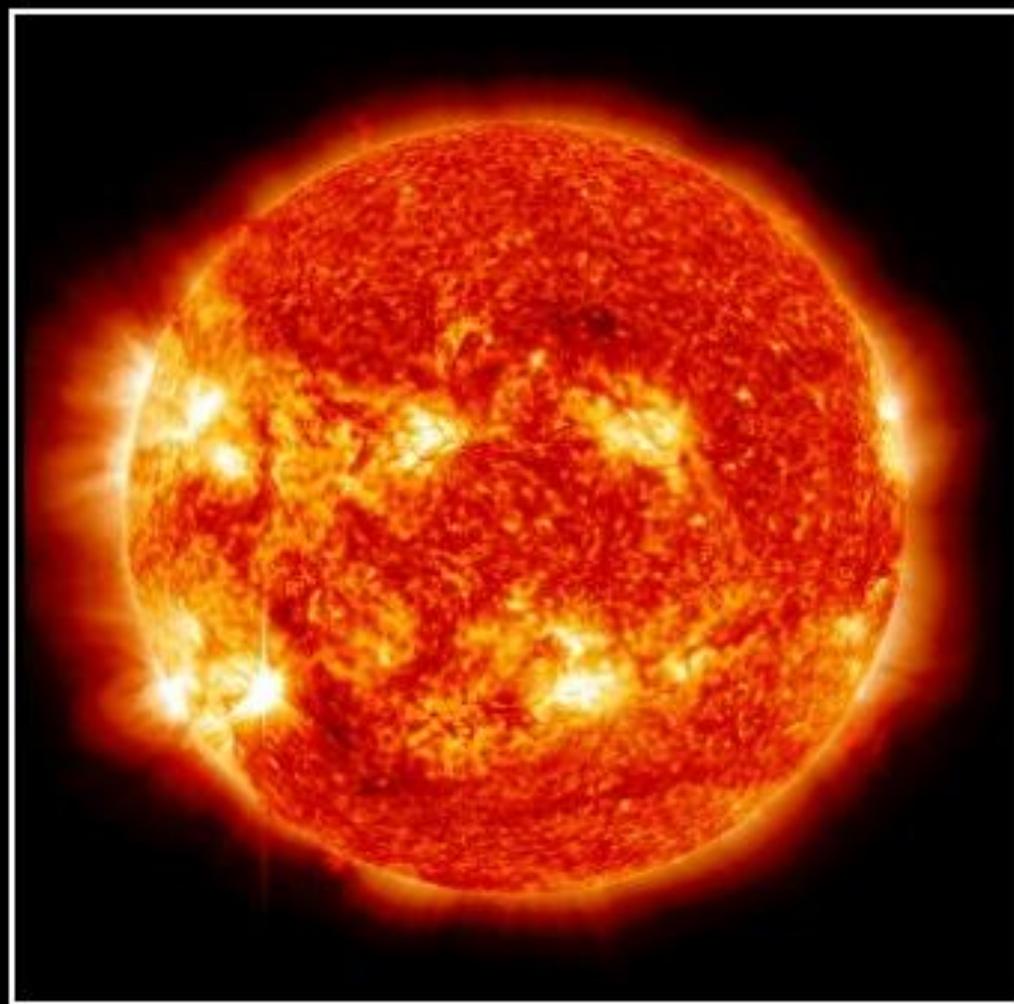

# What I've actually been doing

- Fourier transforms

# FUSION

A source of safe, reliable  
clean energy for the future
