

# **LogiCORE™ 1-Gigabit Ethernet MAC v8.3**

## **Getting Started Guide**

UG143 August 8, 2007

Xilinx is disclosing this Specification to you solely for use in the development of designs to operate on Xilinx FPGAs. Except as stated herein, none of the Specification may be copied, reproduced, distributed, republished, downloaded, displayed, posted, or transmitted in any form or by any means including, but not limited to, electronic, mechanical, photocopying, recording, or otherwise, without the prior written consent of Xilinx. Any unauthorized use of this Specification may violate copyright laws, trademark laws, the laws of privacy and publicity, and communications regulations and statutes.

Xilinx does not assume any liability arising out of the application or use of the Specification; nor does Xilinx convey any license under its patents, copyrights, or any rights of others. You are responsible for obtaining any rights you may require for your use or implementation of the Specification. Xilinx reserves the right to make changes, at any time, to the Specification as deemed desirable in the sole discretion of Xilinx. Xilinx assumes no obligation to correct any errors contained herein or to advise you of any correction if such be made. Xilinx will not assume any liability for the accuracy or correctness of any engineering or technical support or assistance provided to you in connection with the Specification.

THE SPECIFICATION IS PROVIDED "AS IS" WITH ALL FAULTS, AND THE ENTIRE RISK AS TO ITS FUNCTION AND IMPLEMENTATION IS WITH YOU. YOU ACKNOWLEDGE AND AGREE THAT YOU HAVE NOT RELIED ON ANY ORAL OR WRITTEN INFORMATION OR ADVICE, WHETHER GIVEN BY XILINX, OR ITS AGENTS OR EMPLOYEES. XILINX MAKES NO OTHER WARRANTIES, WHETHER EXPRESS, IMPLIED, OR STATUTORY, REGARDING THE SPECIFICATION, INCLUDING ANY WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, TITLE, AND NONINFRINGEMENT OF THIRD-PARTY RIGHTS.

IN NO EVENT WILL XILINX BE LIABLE FOR ANY CONSEQUENTIAL, INDIRECT, EXEMPLARY, SPECIAL, OR INCIDENTAL DAMAGES, INCLUDING ANY LOST DATA AND LOST PROFITS, ARISING FROM OR RELATING TO YOUR USE OF THE SPECIFICATION, EVEN IF YOU HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. THE TOTAL CUMULATIVE LIABILITY OF XILINX IN CONNECTION WITH YOUR USE OF THE SPECIFICATION, WHETHER IN CONTRACT OR TORT OR OTHERWISE, WILL IN NO EVENT EXCEED THE AMOUNT OF FEES PAID BY YOU TO XILINX HEREUNDER FOR USE OF THE SPECIFICATION. YOU ACKNOWLEDGE THAT THE FEES, IF ANY, REFLECT THE ALLOCATION OF RISK SET FORTH IN THIS AGREEMENT AND THAT XILINX WOULD NOT MAKE AVAILABLE THE SPECIFICATION TO YOU WITHOUT THESE LIMITATIONS OF LIABILITY.

The Specification is not designed or intended for use in the development of on-line control equipment in hazardous environments requiring fail-safe controls, such as in the operation of nuclear facilities, aircraft navigation or communications systems, air traffic control, life support, or weapons systems ("High-Risk Applications"). Xilinx specifically disclaims any express or implied warranties of fitness for such High-Risk Applications. You represent that use of the Specification in such High-Risk Applications is fully at your risk.

## Revision History

The following table shows the revision history for this document..

Date	Version	Revision
09/30/04	1.0	Initial Xilinx release.
04/28/05	2.0	Updated to 1-Gigabit Ethernet MAC version 6.0, Xilinx tools 7.1i.
01/18/06	3.0	Updated to 1-Gigabit Ethernet MAC version 7.0, Xilinx tools 8.1i.
07/13/06	4.0	Updated to 1-Gigabit Ethernet MAC version 8.0, Xilinx tools 8.2i.
09/21/06	5.1	Updated to 1-Gigabit Ethernet MAC version 8.1, support for Spartan-3A.
02/15/07	6.0	Updated to 1-Gigabit Ethernet MAC version 8.2, Xilinx tools 9.1i.
08/08/07	7.0	Updated to version 8.3, and supported tool updates for IP1 I Minor release.

# About This Guide

---

This guide provides information about generating a Xilinx LogiCORE™ 1-Gigabit Ethernet MAC (GEMAC) core, customizing and simulating the core using the provided example design, and running the design files through implementation using the Xilinx tools.

## Contents

This guide contains the following chapters:

- [Preface, “About this Guide”](#) introduces the organization and purpose of this guide, a list of additional resources, and the conventions used in this document.
- [Chapter 1, “Introduction”](#) describes the core and related information, including recommended design experience, additional resources, technical support, and submitting feedback to Xilinx.
- [Chapter 2, “Licensing the Core”](#) provides information about licensing the core.
- [Chapter 3, “Quick Start Example Design”](#) provides instructions to quickly generate the core and run the example design through implementation and simulation using the default settings.
- [Chapter 4, “Detailed Example Design”](#) describes the files and directory structure generated by CORE Generator™, the contents of the HDL example design, and the operation of the demonstration test bench.

## Additional Resources

For additional information, go to [www.xilinx.com/support](http://www.xilinx.com/support). The following table lists some of the resources you can access from this website or by using the provided URLs.

Resource	Description/URL
Tutorials	Tutorials covering Xilinx design flows, from design entry to verification and debugging <a href="http://www.xilinx.com/support/techsup/tutorials/index.htm">www.xilinx.com/support/techsup/tutorials/index.htm</a>
Answer Browser	Database of Xilinx solution records <a href="http://www.xilinx.com/xlnx/xil_ans_browser.jsp">www.xilinx.com/xlnx/xil_ans_browser.jsp</a>
Application Notes	Descriptions of device-specific design techniques and approaches <a href="http://www.xilinx.com/xlnx/xweb/xil_publications_index.jsp?category=Application+Notes">www.xilinx.com/xlnx/xweb/xil_publications_index.jsp?category=Application+Notes</a>

Resource	Description/URL
Data Sheets	Device-specific information on Xilinx device characteristics, including readback, boundary scan, configuration, length count, and debugging <a href="http://www.xilinx.com/xlnx/xweb/xil_publications_index.jsp">www.xilinx.com/xlnx/xweb/xil_publications_index.jsp</a>
Problem Solvers	Interactive tools that allow you to troubleshoot your design issues <a href="http://www.xilinx.com/support/troubleshoot/psolvers.htm">www.xilinx.com/support/troubleshoot/psolvers.htm</a>
Tech Tips	Latest news, design tips, and patch information for the Xilinx design environment <a href="http://www.xilinx.com/xlnx/xil_tt_home.jsp">www.xilinx.com/xlnx/xil_tt_home.jsp</a>

## Conventions

This document uses the following conventions. An example illustrates each convention.

### Typographical

The following typographical conventions are used in this document:

Convention	Meaning or Use	Example
<b>Courier font</b>	Messages, prompts, and program files that the system displays	<b>speed grade: - 100</b>
<b>Courier bold</b>	Literal commands you enter in a syntactical statement	<b>ngdbuild</b> <i>design_name</i>
<i>Italic font</i>	Variables in a syntax statement for which you must supply values	See the <i>Development System Reference Guide</i> for more information.
	References to other manuals	See the <i>User Guide</i> for details.
	Emphasis in text	If a wire is drawn so that it overlaps the pin of a symbol, the two nets are <i>not</i> connected.
<text in brackets>	User-defined variable for directory names.	<component_name>
Dark Shading	Items that are not supported or reserved	This feature is not supported
Square brackets [ ]	An optional entry or parameter. However, in bus specifications, such as <b>bus[7:0]</b> , they are required.	<b>ngdbuild</b> [ <b>option_name</b> ] <b>design_name</b>
Braces { }	A list of items from which you must choose one or more	<b>lowpwr</b> = {on off}

Convention	Meaning or Use	Example
Vertical bar	Separates items in a list of choices	<code>lowpwr = {on off}</code>
Vertical ellipsis . . .	Repetitive material that has been omitted	IOB #1: Name = QOUT' IOB #2: Name = CLKIN' . . .
Horizontal ellipsis ...	Repetitive material that has been omitted	<b>allow block</b> <i>block_name</i> <i>loc1 loc2 ... locn;</i>
Notations	The prefix '0x' or the suffix 'h' indicate hexadecimal notation	A read of address 0x00112975 returned 45524943h.
	A '_n' means the signal is active low	usr_teof_n is active low.

## Online Document

The following conventions are used in this document:

Convention	Meaning or Use	Example
Blue text	Cross-reference link to a location in the current document	See the section " <a href="#">Additional Resources</a> " for details. See " <a href="#">Title Formats</a> " in <a href="#">Chapter 1</a> for details.
<a href="#">Blue, underlined text</a>	Hyperlink to a website (URL)	Go to <a href="http://www.xilinx.com">www.xilinx.com</a> for the latest speed files.

## Introduction

---

The 1-Gigabit Ethernet MAC (GEMAC) core is a fully-verified solution that supports Verilog-HDL and VHDL. In addition, the example design in this guide is provided in both Verilog and VHDL.

This chapter introduces the GEMAC core and provides related information, including recommended design experience, additional resources, technical support, and submitting feedback to Xilinx.

## System Requirements

### Windows

- Windows® 2000 Professional with Service Pack 2–4
- Windows XP Professional with Service Pack 1

### Solaris/Linux

- Sun Solaris® 9/10
- Red Hat® Enterprise Linux 4.0 (32-bit and 64-bit)

### Software

- ISE™ 9.2i with applicable service pack

Check the release notes for the required service pack; ISE service packs can be downloaded from [www.xilinx.com/xlnx/xil\\_sw\\_updates\\_home.jsp?update=sp](http://www.xilinx.com/xlnx/xil_sw_updates_home.jsp?update=sp).

## About the Core

The GEMAC core is a Xilinx CORE Generator™ IP core, included in the latest IP Update on the Xilinx IP Center. For detailed information about the core, see [www.xilinx.com/systemio/gmac/index.htm](http://www.xilinx.com/systemio/gmac/index.htm). For information about licensing options, see Chapter 2, “Licensing the Core.”

## Recommended Design Experience

Although the GEMAC core is a fully verified solution, the challenge associated with implementing a complete design varies depending on the configuration and functionality of the application. For best results, previous experience building high-performance, pipelined FPGA designs using Xilinx implementation software and user constraint files (UCF) is recommended.

Contact your local Xilinx representative for a closer review and estimation of your specific requirements.

## Additional Core Resources

For detailed information and updates about the GEMAC core, see the following documents, located on the GEMAC product page at [www.xilinx.com/systemio/gmac/index.htm](http://www.xilinx.com/systemio/gmac/index.htm)

- *1-Gigabit Ethernet MAC Release Notes*
- *1-Gigabit Ethernet MAC Data Sheet*
- *1-Gigabit Ethernet MAC User Guide*

For updates to this document, see the *1-Gigabit Ethernet MAC Getting Started Guide*, also available on the GEMAC product page.

## Technical Support

To obtain technical support specific to the GEMAC core, visit [support.xilinx.com/](http://support.xilinx.com/). Questions are routed to a team of engineers with expertise using the GEMAC core.

Xilinx will provide technical support for use of this product as described in the *1-Gigabit Ethernet MAC User Guide* and the *1-Gigabit Ethernet MAC Getting Started Guide*. Xilinx cannot guarantee timing, functionality, or support of this product for designs that do not follow these guidelines.

## Feedback

Xilinx welcomes comments and suggestions about the GEMAC core and the documentation supplied with the core.

### GEMAC Core

For comments or suggestions about the GEMAC core, please submit a WebCase from [support.xilinx.com/](http://support.xilinx.com/). Be sure to include the following information:

- Product name
- Core version number
- Explanation of your comments

### Document

For comments or suggestions about this document, please submit a WebCase from [support.xilinx.com/](http://support.xilinx.com/). Be sure to include the following information:

- Document title
- Document number
- Page number(s) to which your comments refer
- Explanation of your comments

# Licensing the Core

---

This chapter provides instructions for obtaining a license for the GEMAC core, which you must do before using it in your designs. The GEMAC core is provided under the terms of the [Xilinx LogiCORE Site License Agreement](#), which conforms to the terms of the [SignOnce](#) IP License standard defined by the Common License Consortium. Purchase of the core entitles you to technical support and access to updates for a period of one year.

## Before you Begin

This chapter assumes you have installed the core using either the CORE Generator IP Software Update installer or by performing a manual installation after downloading the core from the web. For information about installing the core, see the core product page [www.xilinx.com/systemio/gmac/index.htm](http://www.xilinx.com/systemio/gmac/index.htm).

## License Options

The GEMAC core provides three licensing options. After installing the core, choose a license option.

### Simulation Only

The Simulation Only Evaluation license is provided with the Xilinx CORE Generator and requires no license key. This license lets you assess the core functionality with either the provided example design or alongside your own design and demonstrate the various interfaces on the core in simulation. (Functional simulation is supported by a dynamically generated HDL structural model).

### Full System Hardware Evaluation

The Full System Hardware Evaluation license is available at no cost and lets you fully integrate the core into an FPGA design, place and route the design, evaluate timing, and perform back-annotated gate-level simulation of the core using the demonstration test bench provided.

In addition, the license lets you generate a bitstream from the placed and routed design, which can then be downloaded to a supported device and tested in hardware. The core can be tested in the target device for a limited time before *timing out* (ceasing to function) at which time it can be reactivated by reconfiguring the device.

## Full

The Full license is provided when you purchase the core and provides full access to all core functionality both in simulation and in hardware, including:

- Functional simulation support
- Back annotated gate-level simulation support
- Full implementation support including place and route and bitstream generation
- Full functionality in the programmed device with no time outs

## Obtaining Your License

### Obtaining a Full System Hardware Evaluation License

To obtain a Full System Hardware Evaluation license, do the following:

- Navigate to the GEMAC product page:  
[www.xilinx.com/systemio/gmac/index.htm](http://www.xilinx.com/systemio/gmac/index.htm).
- Click Evaluate; then click Full System Hardware Evaluation.
- Follow the onscreen instructions to both download the CORE Generator files (delivered as an IP Update) and satisfy any additional requirements associated with the license type.

### Obtaining a Full License

To obtain a Full license, you must purchase the core. After purchase, you will receive a letter containing a serial number, which is used to register for access to the *lounge*, a secured area of the GEMAC product page.

- From the [product page](#), click Register to register and request access to the lounge.
- Xilinx will review your access request and typically grants access to the lounge in 48 hours. (Contact Xilinx Customer Service if you need faster turnaround.)
- After you receive confirmation of lounge access, click Access Lounge on the GEMAC product page and log in.
- Follow the instructions in the lounge to fill out the license request form; then click Submit to automatically generate the license. An email containing the license and installation instructions will be sent to you immediately.

## Installing Your License File

After selecting either the Full System Hardware Evaluation or Full license option, you will receive an email containing instructions for installing your license. In addition, the email provides information about advanced licensing options and technical support.

## Quick Start Example Design

---

This chapter introduces the example design included with the GEMAC core and demonstrates how to generate and use the example design with default options.

### Overview

The GEMAC example design includes the following:

- An instance of the GEMAC core
- An HDL example design top level and sub-components
- A demonstration test bench, to exercise the example design and core

[Figure 3-1](#) illustrates the GEMAC example design and test bench. The example design has been tested with:

- Xilinx ISE 9.2i.
- Mentor Graphics® ModelSim® 6.1e.
- Cadence® IUS® v5.8.

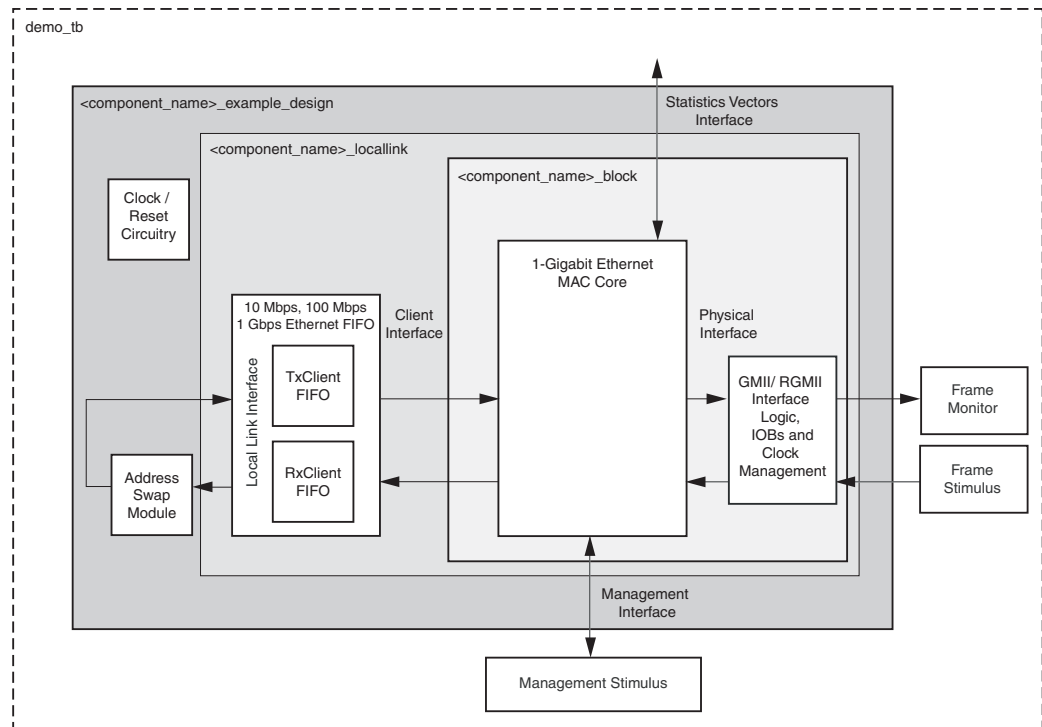

Figure 3-1: Default Example Design and Test Bench

## Generating the Core

This section describes how to generate a GMAC core using the Xilinx CORE Generator™. The generated core contains default values.

### To generate the core:

1. Start the Xilinx CORE Generator.  
For help starting and using the CORE Generator, see the Xilinx CORE Generator Guide, available from the [ISE documentation web page](#).
2. Choose File > New Project.
3. Enter a directory name. In this example, the directory is named *<project\_dir>*.
4. Set project options:
  - a. From the Part tab, select an FPGA family that supports the core; for example, Virtex™-II.  
**Note:** If an unsupported silicon family is selected, the GEMAC core does not appear in the taxonomy tree. For a list of supported architectures, see the *1-Gigabit Ethernet MAC Data Sheet*.  
**Note:** Leave the device, package, and speed grade files at their default values.
  - b. From the Generation tab select VHDL or Verilog for Design Entry select; select Other for Vendor.
  - c. On the Advanced tab, leave Options at default values.
5. After creating the project, locate the directory containing the core in the taxonomy tree.  
The project appears in one of the following:

- Communication & Networking /Ethernet
  - Communication & Networking /Networking
  - Communication & Networking/Telecommunications
6. Double-click the core. If the license file is not properly configured, the CORE Generator displays an error. See [Chapter 2, “Licensing the Core”](#) for details.
  7. If a warning appears regarding the limitations of the available license, click OK. The Gigabit Ethernet MAC customization screen appears.

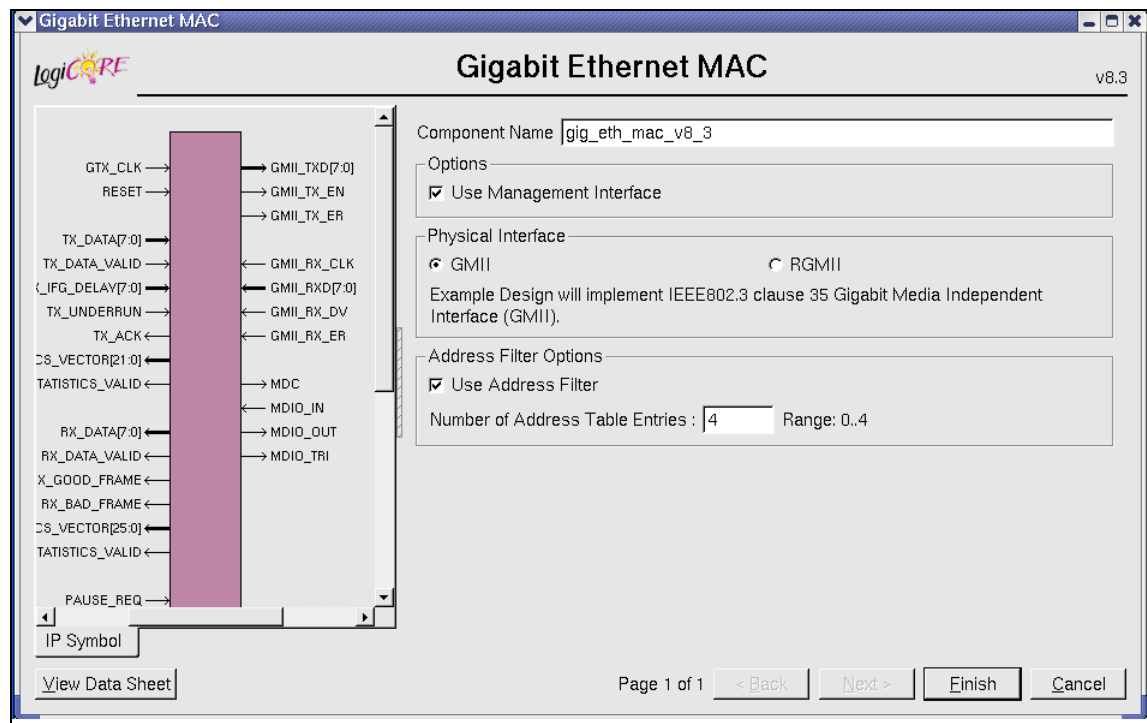

Figure 3-2: Gigabit Ethernet MAC Customization Screen

8. Accept the default values; then click Finish.

The core, named *gig\_eth\_mac\_v8\_3* by default, along with supporting core files including the example design, is generated in the project directory. For detailed information about the example design files and directories see [“Directory and File Contents,”](#) on page 22.

## Implementing the Example Design

**Note:** If the core is generated with a Simulation Only license, the implementation feature of the example design is not available. In this instance, go to [“Running the Simulation,”](#) on page 18.

After the core is generated, the core netlist and example design can be processed by the Xilinx implementation tools. The generated output files include scripts to assist you in running the Xilinx software.

In the implementation example that follows, *gig\_eth\_mac\_v8\_3* is the component name as generated by default from the core customization screen. If a core is generated with a different name, substitute the core name you use in the following commands.

From the CORE Generator project directory window, type the following to implement the GEMAC example design:

### Windows

```
ms-dos> cd gig_eth_mac_v8_3\implement
ms-dos> implement.bat
```

### UNIX

```
unix-shell% cd gig_eth_mac_v8_3/implement
unix-shell% ./implement.sh
```

These commands execute a script that synthesizes, builds, maps, and place-and-routes the example design together with the core netlist. The script also generates a gate-level model of the example design and netlist for use in timing simulation. The resulting files are placed in the results directory, which is created by the implement script at runtime.

## Running the Simulation

### Functional Simulation

To run the functional simulation, you must have the Xilinx Simulation Libraries compiled for your system. For more information, see *Compiling Xilinx Simulation Libraries (COMPXLIB)* in the *Xilinx ISE Synthesis and Verification Design Guide*. These guides can be obtained from [www.xilinx.com/support/software\\_manuals.htm](http://www.xilinx.com/support/software_manuals.htm).

In the simulation examples that follow, *<project\_dir>* is the CORE Generator project directory and *gig\_eth\_mac\_v8\_3* is the component name as generated by default from the core customization screen. If a core has been generated with a different name, substitute that core name in the following commands.

### VHDL Simulation

#### To run a VHDL functional simulation using Mentor ModelSim

1. Launch the ModelSim simulator and set the current directory to  
`<project_dir>/gig_eth_mac_v8_3/simulation/functional`
2. Map the UniSim library:  
`ModelSim> vmap unisim <path to compiled libraries>/unisim`
3. Launch the simulation script:  
`ModelSim> do simulate_mti.do`

#### To run a VHDL functional simulation using Cadence IUS

1. Open a command prompt or shell in your project directory, then set the current directory to:  
`<project_dir>/gig_eth_mac_v8_3/simulation/functional`
2. Launch the simulation script:  
`./simulate_ncsim.sh`

The scripts compile the structural VHDL model for the core, the example design HDL files and the demonstration test bench. It adds some relevant signals to a wave window, then runs the simulation to completion. At this point, you can review the simulation transcript and waveform to observe the operation of the core.

## Verilog Simulation

### To run a Verilog functional simulation using Mentor ModelSim

1. Launch the ModelSim simulator and set the current directory to  
`<project_dir>/gig_eth_mac_v8_3/simulation/functional`
2. Map the UniSim library:  
`ModelSim> vmap unisims_ver <path to compiled libraries>/unisims_ver`
3. Launch the simulation script:  
`ModelSim> do simulate_mti.do`

### To run a Verilog functional simulation using Cadence IUS

1. Open a command prompt or shell in your project directory, then set the current directory to:  
`<project_dir>/gig_eth_mac_v8_3/simulation/functional`
2. Launch the simulation script:  
`./simulate_ncsim.sh`

The scripts compile the structural Verilog model for the core, the example design HDL files and the demonstration test bench. It adds some relevant signals to a wave window, then runs the simulation to completion. At this point, you can review the simulation transcript and waveform to observe the operation of the core.

## Timing Simulation

**Note:** If the core is generated with a Simulation Only license, the timing simulation feature of the example design is not available. In this case, proceed to “What’s Next?” on page 20.

To run the gate-level simulation, you must have the Xilinx Simulation Libraries compiled for your system. For more information, see *Compiling Xilinx Simulation Libraries (COMPXLIB)* in the *Xilinx ISE Synthesis and Verification Design Guide*, which can be obtained from [www.xilinx.com/support/software\\_manuals.htm](http://www.xilinx.com/support/software_manuals.htm).

In the simulation examples that follow, `<project_dir>` is the CORE Generator project directory; `gig_eth_mac_v8_3` is the component name as generated by default from the core customization screen. If a core has been generated with a different name, substitute the core name in the following commands.

## VHDL Simulation

### To run a VHDL timing simulation using Mentor ModelSim

1. Launch the ModelSim simulator and set the current directory to  
`<project_dir>/gig_eth_mac_v8_3/simulation/timing`
2. Map the SimPrim library:  

```
ModelSim> vmap simprim <path to compiled libraries>/simprim
```
3. Launch the simulation script:  

```
ModelSim> do simulate_mti.do
```

### To run a VHDL timing simulation using Cadence IUS

1. Open a command prompt or shell in your project directory, then set the current directory to:  
`<project_dir>/gig_eth_mac_v8_3/simulation/timing`
2. Launch the simulation script:  
`./simulate_ncsim.sh`

The scripts compile the gate-level model of the example design, generated in the implementation stage, and the demonstration test bench. It adds some relevant signals to a wave window, then runs the simulation to completion. At this point, you can review the simulation transcript and waveform to observe the operation of the core.

## Verilog Simulation

### To run a Verilog timing simulation using Mentor ModelSim

1. Launch the ModelSim simulator and set the current directory to  
`<project_dir>/gig_eth_mac_v8_3/simulation/timing`
2. Map the SimPrim library:  

```
ModelSim> vmap simprim_ver <path to compiled libraries>/simprim_ver
```
3. Launch the simulation script:  

```
ModelSim> do simulate_mti.do
```

### To run a Verilog timing simulation using Cadence IUS

1. Open a command prompt or shell in your project directory, then set the current directory to:  
`<project_dir>/gig_eth_mac_v8_3/simulation/timing`
2. Launch the simulation script:  
`./simulate_ncsim.sh`

The scripts compile the gate-level model of the example design, generated in the implementation stage, and the demonstration test bench. It adds some relevant signals to a wave window, and then runs the simulation to completion. At this point, you can review the simulation transcript and waveform to observe the operation of the core.

## What's Next?

For more information about the example design, including guidelines on modifying the design and extending the test bench, see [Chapter 4, "Detailed Example Design."](#) To begin using the GEMAC core in your own design, see the *1-Gigabit Ethernet MAC User Guide*.

## Detailed Example Design

---

This chapter provides detailed information about the example design, including a description of files and the directory structure generated by the Xilinx CORE Generator, the purpose and contents of the provided scripts, the contents of the example HDL wrappers, and the operation of the demonstration test bench.

-  **<project directory>**  
Top-level project directory; name is user-defined.
  -  **<project directory>/<component name>**  
Core release notes file
    -  **<component name>/doc**  
Product documentation
    -  **<component name>/example\_design**  
Verilog and VHDL design files
      -  **example\_design/fifo**  
FIFO directory, contains files for the FIFO instanced in LocalLink example design
      -  **example\_design/physical**  
Files for the physical interface of the MAC
    -  **<component name>/implement**  
Implementation script files
      -  **implement/results**  
Results directory, created after implementation scripts are run, and contains implement script results
    -  **<component name>/simulation**  
Simulation scripts
      -  **simulation/functional**  
Functional simulation files
      -  **simulation/timing**  
Timing simulation files

## Directory and File Contents

The core directories and their associated files are defined in the following sections.

**Note:** The implement and timing simulation directories are only present when the core is generated with a Full System Hardware Evaluation license or Full license.

### <project directory>

The project directory contains all the CORE Generator project files.

Table 4-1: Project Directory

Name	Description
<project_dir>	
<component_name>.ngc	Binary Xilinx implementation netlist. Describes how the core is to be implemented. Used as input to the Xilinx™ Implementation Tools.
<component_name>.v[hd]	VHDL or Verilog structural simulation model. File used to support VHDL or Verilog functional simulation of a core. The VHDL or Verilog model passes customized parameters to the generic core simulation model.
<component_name>.xco	As an output file, the XCO file is a log file that records the settings used to generate a particular core. An XCO file is generated by the CORE Generator for each core that it creates in the current project directory. An XCO file can also be used as an input to the CORE Generator.
<component_name>_flist.txt	Text file listing all of the output files produced when customized core was generated in the CORE Generator.
<component_name>.{vho veo}	VHDL or Verilog template for the core, which can be copied into the user design.

[Back to Top](#)

### <project directory>/<component name>

The <component name> directory contains the release notes file provided with the core, which may include last-minute changes and updates.

Table 4-2: Component Name Directory

Name	Description
<project_dir>/<component_name>	
gig_eth_mac_release_notes.txt	Core release notes file.

[Back to Top](#)

## <component name>/doc

The doc directory contains the PDF documentation provided with the core.

**Table 4-3: Doc Directory**

Name	Description
<project_dir>/<component_name>/doc	
gig_eth_mac_ds200.pdf	1-Gigabit Ethernet MAC Data Sheet
gig_eth_mac_ug144.pdf	1-Gigabit Ethernet MAC User Guide.
gig_eth_mac_gsg143.pdf	1-Gigabit Ethernet MAC Getting Started Guide.

[Back to Top](#)

## <component name>/example\_design

The example design directory contains the example design files provided with the core. See “Example Design,” page 29 for more information.

**Table 4-4: Example Design Directory**

Name	Description
<project_dir>/<component_name>/example_design	
<component_name>_example_design.v[hd]	Top-level VHDL or Verilog file for the example design. This instantiates the LocalLink block along with the address swap block, providing a simple loopback function.
<component_name>_example_design.ucf	User constraints file (UCF) for the core and the example design.
<component_name>_locallink.v[hd]	Example design with a LocalLink client interface. This instantiates the block level GEMAC wrapper together with a receive and a transmit FIFO.
<component_name>_block.v[hd]	Block level GEMAC wrapper containing the core and all clocking and physical interface circuitry.
<component_name>_mod.v	Verilog module declaration for the core instance in the block level example design.
address_swap_module.v[hd]	Top-level example design instances this to swap the source and destination addresses of the incoming frames.

[Back to Top](#)

## example\_design/fifo

This directory contains the files for the FIFO that is instantiated in the LocalLink example design.

**Table 4-5: FIFO Directory**

Name	Description
<project_dir>/<component_name>/example_design/fifo	
tx_client_fifo.v[hd]	Transmit client FIFO. This takes data from the client in LocalLink format, stores it and sends it to the MAC.
rx_client_fifo.v[hd]	Receive client FIFO. This reads in and stores data from the MAC before outputting it to the client in LocalLink format.
ten_100_1g_eth_fifo.v[hd]	FIFO top level. This instantiates the transmit and receive client FIFOs.

[Back to Top](#)

## example\_design/physical

This directory contains a file for the physical interface of the MAC. A GMII or RGMII version will be delivered by CORE Generator depending on the selected option.

**Table 4-6: Physical Directory**

Name	Description
<project_dir>/<component_name>/example_design/physical	
gmii_if.v[hd]	All clocking and logic required to provide a GMII physical interface.
rgmii_v2_0_if.v[hd]	All clocking and logic required to provide a RGMII v2.0 physical interface.

[Back to Top](#)

## <component name>/implement

This directory contains the support files necessary for implementation of the example design with the XILINX tools. For more information, see [“Example Design,” page 29](#). Execution of an implement script results in creation of the results directory and an xst project directory.

**Table 4-7: Implement Directory**

Name	Description
<project_dir>/<component_name>/implement	
implement.sh	UNIX shell script that processes the example design through the Xilinx tool flow.
implement.bat	Windows batch file that processes the example design through the Xilinx tool flow.
xst.prj	XST project file for the example design; it enumerates all the HDL files that need to be synthesised.
xst.scr	XST script file for the example design.

[Back to Top](#)

## implement/results

This directory is created by the implement scripts and is used to run the example design files and the <component\_name>.ngc file through the Xilinx implementation tools. On completion of an implement script, this directory contains the following files for timing simulation.

Output files from the Xilinx implementation tools are also located in this directory.

**Table 4-8: Results Directory**

Name	Description
<project_dir>/<component_name>/implement/results	
routed.v[hd]	The back-annotated SimPrim based gate-level VHDL or Verilog model. Used for timing simulation.
routed.sdf	Timing information for simulation.

[Back to Top](#)

## <component name>/simulation

The simulation directory and sub-directories below it provide the files necessary to test a VHDL implementation of the example design.

**Table 4-9: Simulation Directory**

Name	Description
<project_dir>/<component_name>/simulation	
demo_tb.v[hd]	VHDL or Verilog demonstration test bench for the GEMAC core.

[Back to Top](#)

## simulation/functional

The functional directory contains functional simulation scripts provided with the core.

**Table 4-10: Functional Directory**

Name	Description
<project_dir>/<component_name>/simulation/functional	
simulate_mti.do	ModelSim macro file that compiles the example design sources and the structural simulation model, then runs the functional simulation to completion.
wave_mti.do	ModelSim macro file that opens a wave window and adds interesting signals to it. It is called by the simulate_mti.do macro file.
simulate_ncsim.sh	UNIX shell script that compiles the example design sources and the structural simulation model then runs the functional simulation to completion using Cadence IUS.
wave_ncsim.sv	IUS macro file that opens a wave window and adds interesting signals to it. It is used by the simulate_ncsim.sh script.

[Back to Top](#)

## simulation/timing

The timing directory contains timing simulation scripts provided with the core.

Table 4-11: Timing Directory

Name	Description
<project_dir>/<component_name>/simulation/timing	
simulate_mti.do	ModelSim macro file that compiles the VHDL gate-level model of the example design and demo test bench, then runs the timing simulation to completion.
wave_mti.do	ModelSim macro file that opens a wave window and adds interesting signals to it. It is called by the simulate_mti.do macro file.
simulate_ncsim.sh	UNIX shell script that compiles the example design sources and the VHDL gate-level model, then runs the timing simulation to completion using Cadence IUS.
wave_ncsim.sv	IUS macro file that opens a wave window and adds interesting signals to it. It is used by the simulate_ncsim.sh script.

## Implementation and Test Scripts

### Implementation Scripts for Timing Simulation

When CORE Generator has been run with a Full-system Evaluation License or a Full License an implement script is generated in the <project\_dir>/<component\_name>/implement directory. The implementation script is either a shell script or batch file that processes the example design through the Xilinx tool flow.

#### UNIX

```
<project_dir>/<component_name>/implement/implement.sh
```

#### Windows

```
<project_dir>/<component_name>/implement/implement.bat
```

The implement script performs the following steps:

1. The HDL example design is synthesised using XST.
2. Ngdbuild is run to consolidate the core netlist and the HDL example netlist into the NGD file containing the entire design.
3. The design is mapped to the target technology.
4. The design is placed-and-routed on the target device.

5. Static timing analysis is performed on the routed design using trce.
6. A bitstream is generated.
7. Netgen runs on the routed design to generate VHDL or Verilog gate-level models and timing information in the form of SDF files.

The Xilinx tool flow generates several output and report files. These files are saved in the following directory, created by the implement script:

```
<project_dir>/<component_name>/implement/results
```

## Test Scripts For Functional Simulation

The functional simulation flow is available no matter which license type has been used by CORE Generator. The test script that automates the simulation of the test bench is located at:

### Mentor ModelSim

```
<project_dir>/<component_name>/simulation/functional/  
simulate_mti.do
```

### Cadence IUS

```
<project_dir>/<component_name>/simulation/functional/  
simulate_ncsim.sh
```

The test script performs the following tasks:

1. Compiles the structural simulation model of the core.
2. Compiles the example design files.
3. Compiles the demonstration test bench.
4. Starts a simulation of the test bench with no timing information.
5. Opens a Wave window and adds some signals of interest.
6. Runs the simulation to completion.

## Test Scripts For Timing Simulation

When the CORE Generator has been run with a Full System Hardware Evaluation license or Full license, a test script for running timing simulation is generated. The test script that automates the simulation of the test bench is located at:

### Mentor ModelSim

```
<project_dir>/<component_name>/simulation/timing/simulate_mti.do
```

### Cadence IUS

```
<project_dir>/<component_name>/simulation/timing/simulate_ncsim.sh
```

The test script performs the following tasks:

1. Compiles the gate-level model of the example design.
2. Compiles the demonstration test bench.
3. Starts a simulation of the test bench using timing information.
4. Opens a Wave window and adds some signals of interest.
5. Runs the simulation to completion.

## Example Design

### HDL Example Design

Figure 4-1 illustrates the top-level design for the GEMAC core example design.

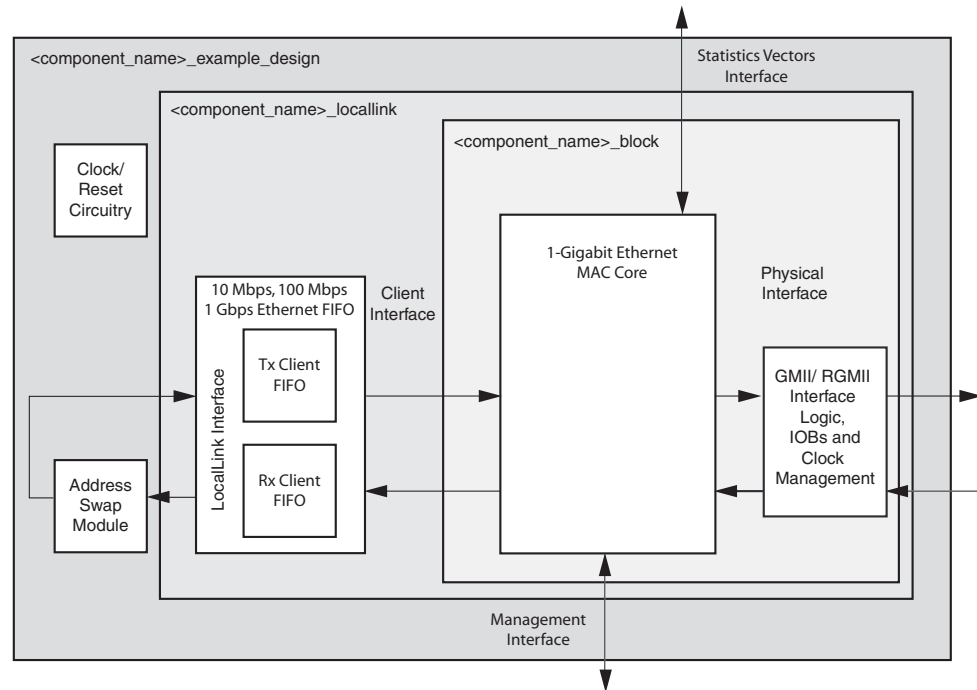

Figure 4-1: Example Design HDL Wrapper

The top-level example design for the GEMAC is described in the following files:

#### VHDL

```
<project_dir>/<component_name>/example_design/  
<component_name>_example_design.vhd
```

#### Verilog

```
<project_dir>/<component_name>/example_design/  
<component_name>_example_design.v
```

The HDL example design contains the following:

- An instance of the GEMAC core
- Clock management logic, including DCM and Global Clock Buffer instances, where required
- GMII or RGMII interface logic, including IOB and DDR registers instances, where required
- Client Transmit and Receive FIFOs with a LocalLink interface
- Client LocalLink loopback module that performs address swapping

The HDL example design provides client loopback functionality on the client side of the GEMAC core and connects the GMII/RGMII interface to external IOBs. This allows the

functionality of the core to be demonstrated either using a simulation package, as discussed in this guide, or in hardware, if placed on a suitable board.

## 10M/100M/1G Ethernet FIFO

The 10 Mbps/100 Mbps/1 Gbps Ethernet FIFO is described in the following files:

### VHDL

```
<project_dir>/<component_name>/example_design/fifo/ten_100_1g_eth_fifo.vhd
<project_dir>/<component_name>/example_design/fifo/tx_client_fifo.vhd
<project_dir>/<component_name>/example_design/fifo/rx_client_fifo.vhd
```

### Verilog

```
<project_dir>/<component_name>/example_design/fifo/ten_100_1g_eth_fifo.v
<project_dir>/<component_name>/example_design/fifo/tx_client_fifo.v
<project_dir>/<component_name>/example_design/fifo/rx_client_fifo.v
```

For a full description of the 10 Mbps/100 Mbps/1 Gbps Ethernet FIFO, see Appendix A, “Using the Client Side FIFO” in the *1-Gigabit Ethernet MAC User Guide*.

See also [direct.xilinx.com/bvdocs/apnotes/xapp691.pdf](http://direct.xilinx.com/bvdocs/apnotes/xapp691.pdf) for a detailed description of the LocalLink interface.

The 10 Mbps/100 Mbps/1 Gbps Ethernet FIFO contains an instance of `tx_client_fifo` to connect to the MAC client side transmitter interface, and an instance of the `rx_client_fifo` to connect to the MAC client receiver interface, via the address swap module. Both transmit and receive FIFO components implement a LocalLink user interface, through which the frame data can be read/written. Figure 4-2 illustrates a straightforward frame transfer across a LocalLink interface.

Figure 4-2: Frame Transfer across LocalLink Interface

### rx\_client\_fifo

The `rx_client_fifo` is built around two Dual Port block RAMs, providing a total memory capacity of 4096 bytes. The receive FIFO will write in data received through the MAC. If the frame is marked as good by the MAC, that frame will then be presented on the LocalLink interface for reading by the user, (in this case the `tx_client_fifo` module). If the frame is marked as bad, that frame will be dropped by the FIFO.

If the receive FIFO memory overflows, the frame currently being received is dropped, regardless of whether it is a good or bad frame, and the signal `rx_overflow` is asserted.

Situations in which the memory may overflow are:

- The FIFO may overflow if the receiver clock is running at a faster rate than the transmitter clock or if the interpacket gap between the received frames is smaller than the interpacket gap between the transmitted frames. If this is the case the tx FIFO will not be able to read data from the rx FIFO as fast as it is being received.
- The FIFO size of 4096 bytes limits the size of the frames that it can store without error. If a frame is larger than 4000 bytes then the FIFO may overflow and data will be lost. It is therefore recommended that the example design is not used with the GEMAC in jumbo frame mode for frames of larger than 4000 bytes.

### tx\_client\_fifo

The `tx_client_fifo` is built around two Dual Port block RAMs, providing a total memory capacity of 4096 bytes.

When a full frame has been written into the transmit FIFO, the FIFO presents data to the MAC transmitter. On receiving the `tx_ack` signal from the MAC, the rest of the frame is transmitted to the MAC.

If the FIFO memory fills up, the `dst_rdy_out_n` signal is used to stop the LocalLink interface from writing further data until space becomes available in the FIFO. If the FIFO memory fills up but no full frames are available for transmission (for example, if a frame larger than 4000 bytes is written into the FIFO), the FIFO asserts the `tx_overflow` signal and continues to accept the rest of the frame. The overflow frame is then dropped by the FIFO, ensuring that the LocalLink interface does not lock up.

### VHDL

The generic `FULL_DUPLEX_ONLY` is provided to allow removal of logic and performance constraints necessary only in half-duplex operation; that is, when the FIFO is used with the Tri-Mode Ethernet MAC (TEMAC) core. This generic can always be set to *true* when the FIFO is used with the GEMAC.

### Verilog

The compiler directive `FULL_DUPLEX_ONLY` is defined to allow removal of logic and performance constraints necessary only in half-duplex operation; that is, when the FIFO is used with the Tri-Mode Ethernet MAC (TEMAC) core. This directive can always be defined when the FIFO is used with the GEMAC.

## Address Swap Module

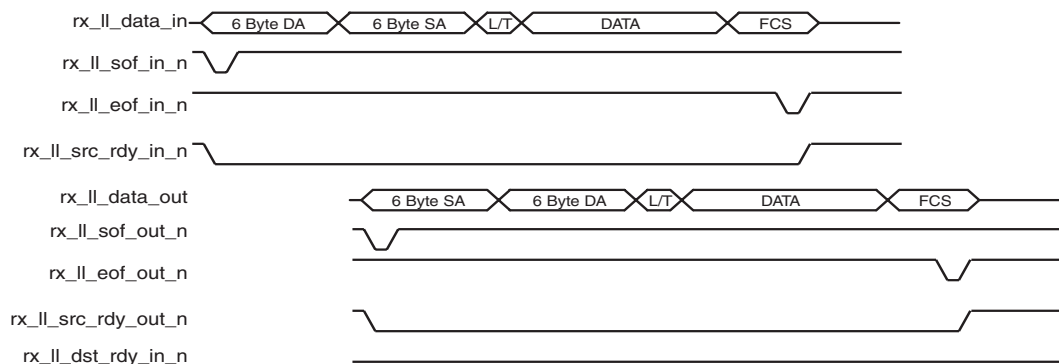

The address swap module is described in the following files:

### VHDL

```
<project_dir>/<component_name>/example_design/address_swap_module.vhd
```

### Verilog

```
<project_dir>/<component_name>/example_design/address_swap_module.v
```

**Figure 4-3: Modification of Frame Data by Address Swap Module**

The address swap module takes frame data from the GEMAC receiver client interface. As illustrated in [Figure 4-3](#), the module swaps the destination address (DA) and source address (SA) of each frame, which ensures that the outgoing frame destination address matches the source address of the link partner. The module transmits the frame control signals with an equal latency to the frame data.

## Demonstration Test Bench

### Test Bench Functionality

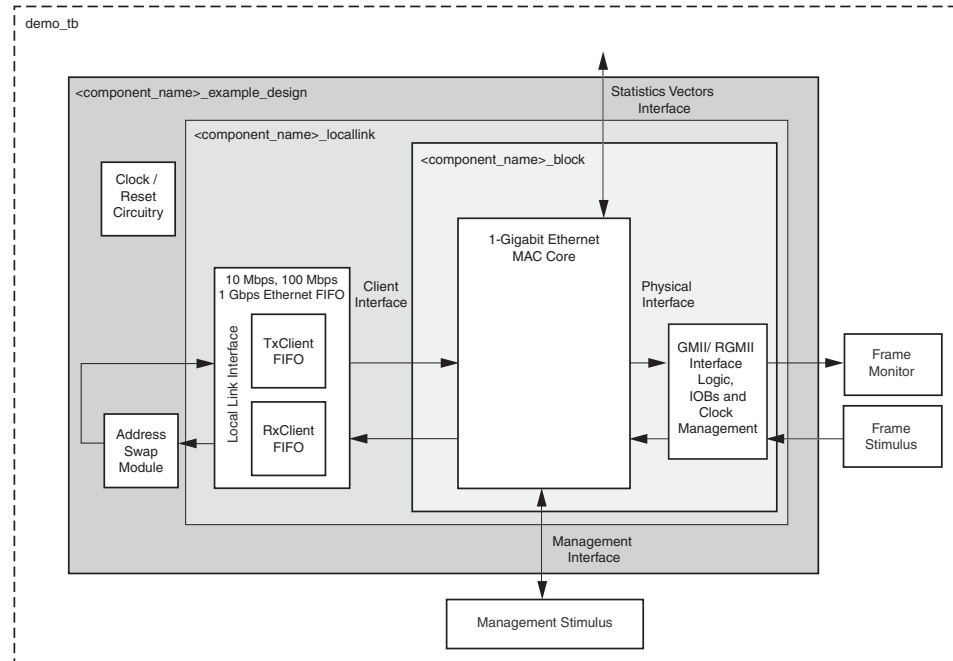

Figure 4-4: Demonstration Test Bench

The demonstration test bench is described in the following files:

#### VHDL

`<project_dir>/<component_name>/simulation/demo_tb.vhd`

#### Verilog

`<project_dir>/<component_name>/simulation/demo_tb.v`

The demonstration test bench is a simple VHDL or Verilog program to exercise the example design and the core itself.

The test bench consists of the following:

- Clock generators
- A stimulus block that connects to the GMII/ RGMII receiver interface of the example design
- A monitor block to check data returned through the GMII/RGMII transmitter interface
- A management block to exercise the Management Interface, if selected
- A control mechanism to manage the interaction of management, stimulus and monitor blocks

## Core with Management Interface

The demonstration test bench performs the following tasks:

1. Input clock signals are generated.
2. A reset is applied to the example design.
3. The GEMAC core is configured through the Management Interface, setting up the MDC clock frequency, disabling flow control, and if the Address Filter is selected, writing to the Unicast Address registers and enabling the Address Filter.
4. The stimulus block pushes four frames into the GMII/RGMII receiver interface:
  - + The first frame is a minimum length frame
  - + The second frame is a type frame
  - + The third frame is an errored frame
  - + The fourth frame is a padded frame
5. The frames received at the GMII/RGMII transmitter interface are checked against the stimulus frames to ensure data is the same. The monitor process takes into account the source/destination address field and FCS modifications resulting from the address swap module.

## Core with No Management Interface

Because no Management Interface is present, the configuration of the GEMAC core is controlled by hard wiring of the configuration vector to required logic levels. See the *1-Gigabit Ethernet MAC User Guide* for more information about the configuration vector.

The demonstration test bench performs the following tasks:

1. Input clock signals are generated
2. A reset is applied to the example design
3. The stimulus block pushes four frames into the GMII/RGMII receiver interface:
  - + The first frame is a minimum length frame
  - + The second frame is a type frame
  - + The third frame is an errored frame
  - + The fourth frame is a padded frame
4. The frames received at the GMII/RGMII transmitter interface are checked against the stimulus frames to ensure data is the same. The monitor process takes into account the source/destination address field and FCS modifications resulting from the address swap module.

## Changing the Test Bench

### Changing Frame Data

You can change the contents of the frame data passed into the GEMAC receiver by changing the data fields for each frame defined in the test bench. The test bench will automatically calculate the new FCS field to pass into the GEMAC, as well as calculating the new expected FCS value.

Further frames can be added by defining a new frame of data. Care should be taken to update the expected statistics values if the statistics option has been chosen.

## Changing Frame Error Status

Errors can be inserted into any of the predefined frames in the following way:

- A `gmii_rx_er` signal can be asserted by changing the error field to '1' in any column of that frame.

When an error is introduced into a frame, the bad frame field for that frame must be set in order to disable the monitor checking for that frame. If statistics option has been chosen, the expected statistics values also need to be modified accordingly.

The error currently written into the third frame can be removed by setting all error fields for the frame to '0' and unsetting the bad frame field.

## Changing the GEMAC Configuration

The configuration of the GEMAC used in the demonstration test bench can be altered.

**Caution!** Certain configurations of the GEMAC cause the test bench to result in failure or to cause processes to run indefinitely. You must determine the configurations that can safely be used with the test bench.

If the Management Interface option is selected, the GEMAC can be reconfigured by adding further steps in the test bench management process to write new configurations to the GEMAC. See the *1-Gigabit Ethernet MAC User Guide* for more information about the Management Interface.

If the Management Interface option is not selected, the GEMAC can be reconfigured by modifying the configuration vector directly. See the *1-Gigabit Ethernet MAC User Guide* for information about the configuration vector.
